

EU AI Act Compliance Checklist

For healthcare organisations, insurers & AI teams · High-Risk AI Systems

FULL COMPLIANCE DEADLINE
August 2, 2026 — 4 months away

Healthcare AI is classified as HIGH-RISK under the EU AI Act. Use this checklist to assess your readiness before regulators do it for you. Each item maps to a specific obligation under Regulation (EU) 2024/1689.

Embedded systems

01 Risk ClassificationAug 2026

- Confirm whether your AI system is high-risk under Annex III (clinical decision support, risk scoring, triage, disease prediction = high-risk).
- Document your classification decision with supporting rationale, even if you conclude the system is not high-risk.
- Assess whether your system profiles individuals — if yes, it is always classified as high-risk.

02 Data Governance & BiasAug 2026

- Examine training, validation, and test data for potential biases across demographic subgroups (age, sex, ethnicity, socioeconomic status).
- Document data sources, provenance, and any known limitations or gaps in population coverage.
- Implement ongoing data quality monitoring in production — not just at model launch.
- Run individual fairness checks: are clinically similar patients receiving consistent predictions?

03 Model Explainability & TransparencyAug 2026

- Ensure your model provides explanations that a clinician or regulator can meaningfully interpret (e.g. SHAP values, feature attribution).
- Label AI-generated outputs clearly so end users (clinicians, patients) know a prediction was AI-generated.
- Maintain technical documentation covering model architecture, training methodology, evaluation results, and known limitations.

04 Human OversightFeb 2025 ■

- Ensure a qualified human can review, override, or halt any AI-generated recommendation before it affects patient care.
- Define and document who is responsible for oversight, how they are trained, and under what conditions they must intervene.
- Avoid designing workflows where human sign-off is a rubber stamp with no meaningful review capability.

05 Risk Management SystemAug 2026

- Establish a documented, ongoing risk management process covering the full AI lifecycle — not just pre-deployment.
- Conduct regular re-assessments when the system is updated, when deployment context changes, or when new risks are identified.
- Maintain records of risk assessments, mitigation actions taken, and residual risks accepted.

06 Accuracy, Robustness & MonitoringAug 2026

- Define appropriate accuracy metrics for your use case and document performance benchmarks at launch.
- Implement production monitoring for model drift, performance degradation, and fairness across subgroups on an ongoing basis.
- Establish alert thresholds and a clear process for responding when performance falls below acceptable levels.

07 Logging & AuditabilityAug 2026

- Log all AI system inputs, outputs, and decisions in a format that supports post-hoc investigation.
- Retain logs for a minimum period sufficient to support regulatory review (minimum 10 years for healthcare in some jurisdictions).
- Ensure logs are tamper-evident and accessible to authorised regulators on request.

08 AI Literacy (Staff Training)Feb 2025 ■

- All staff involved in operating or using the AI system must have sufficient AI literacy — this obligation is already live.
- Training must be tailored to the technical level of the staff and the specific AI system being used.
- Document training completion, content covered, and dates — regulators may treat inadequate training as an aggravating factor.

Not sure where your AI system stands?
